Long Beach Water Department Increases Efficiency with AVEVA SCADA Solution

Long Beach Water Department - www.lbwater.org
Industry - Water & Wastewater

Goals

- Keep the city's 487,000 residents adequately supplied with clean, good-tasting water
- Provide safe delivery of wastewater to nearby sewage treatment facilities

Challenges

- Keep the city's 487,000 residents adequately supplied with clean, good-tasting water
- Provide safe delivery of wastewater to nearby sewage treatment facilities

Solution

- InTouch® HMI
- Historian
- ActiveFactory
- Historian Clients

Results

- Solution resulted in an average annual return of \$300,000 on the current investment
- Help operate and maintain nearly 765 miles of sewer lines, and deliver more than 40 million gallons of wastewater per day to Los Angeles County sanitation district facilities

LONG BEACH, California – It can be an especially challenging task to deliver uninterrupted, crystal-clear drinking water to the fifth largest city in the state of California. Yet, the Long Beach Water Department (LBWD) successfully completes this mission 24 hours a day, seven days a week, all the while consistently meeting or surpassing federal and state drinking water-quality regulations.

“With the new AVEVA system... we estimate an average annual return of \$300,000 on the current investment.”

-
Ray Gonzales
Telecommunications Manager

However, keeping the city’s 487,000 residents adequately supplied with clean, good-tasting water is only part of the story. The water department also is responsible for the safe delivery of wastewater to its nearby sewage treatment facilities. LBWD operates and maintains nearly 765 miles of sewer lines, safely and swiftly removing sewage from residences and businesses throughout the city and delivering more than 40 million gallons of wastewater per day to Los Angeles County sanitation district facilities located on the north and south sides of Long Beach.

Operating its remote facilities and treatment plants efficiently is no small feat and requires the Long Beach Water Department to use sophisticated technology solutions to help it maintain communications over the entire system in real time.

To enable the control room staff to effectively monitor and manage more than 90 remote telemetry units (RTUs) and its groundwater treatment facility, the water department selected a comprehensive solution from AVEVA. AVEVA’s Historian Clients, ActiveFactory and AVEVA Historian are used for engineering and development applications throughout the municipal water district.

“Installing AVEVA’s open system has enabled LBWD to not only improve efficiencies but continually lay the groundwork for future increases in the effectiveness of the city’s groundwater and sewage treatment systems,” said Ray Gonzales, the Long Beach Water Department’s telecommunications manager. “Supporting a large city such as Long Beach requires the accurate monitoring and control of all our facilities, and AVEVA’s solutions provided the right tools to help us accomplish this.”

The SCADA configuration for the district’s water system is complex and gathers information from nearly 30,000 different data points via RTU sites and programmable logic controllers (PLCs) at 85 major equipment sites. The system is PC-based and uses the Microsoft® Windows® XP operating system with AVEVA’s InTouch human-machine interface (HMI) software, which provides real-time visualization capabilities to monitor and control different sites.

The Long Beach Water Department programmed its PLC processor to poll the 40 remote sites throughout the water system an average of once every minute to ensure efficient operations. The data is stored in an AVEVA Historian. It combines the power and flexibility of a relational database with the speed and compression of a real-time system, enabling the water department’s main office to have simultaneous access to multiple data inputs from pumps, valves and equipment throughout the city.

The AVEVA Historian provides operators with a complete picture of the city’s water system processes at any given time, thereby improving overall performance. With this level of visibility, subtle water treatment process inefficiencies and any water-quality problems can be corrected immediately.

Additional data critical to operations, such as where a leak on a pipeline has occurred, can be transferred back to the central site in real time.

By alerting the primary station that the leak has occurred, operators can then perform necessary analysis and control activities. For instance, they can determine if the leak is critical and then share a description of the leak in a logical and organized fashion using the Historian Clients software. With accurate information in view, operators can increase response time by remotely turning pumps on or off or adjusting valves without having to waste time sending staff to the specific location to fix the problem.

The ability to remotely control equipment also is very important to the water department as it enables the district to adjust water pressure in emergency situations. This may include pumping water to an area where there's a fire or increasing water pressure to hillsides for improved water availability.

In addition, collecting information from RTUs in real time enables the department to more easily monitor field equipment and perform critical system maintenance. The data can be analyzed to predict system problems. For example, staff can proactively replace potentially defective pumps or valves before they actually create trouble.

The control-room operators and engineers in the water district's treatment plant also use AVEVA's ActiveFactory trending and analysis software to generate daily reports. The ActiveFactory software maximizes the value of the data stored in the water department's AVEVA Historian. Users can generate reports directly from the operator's InTouch HMI screen or feed data into a program such as Microsoft Excel to analyze trends in the chemical and groundwater treatment processes.

"Trending and analysis are critical components of our water operations program because they help us to make informed decisions to ensure proper water-quality levels," Gonzales said. "The ability to troubleshoot potential problems and view real-time and historical process data makes the AVEVA Historian and ActiveFactory software invaluable tools for LBWD's overall operations."

As a key component of AVEVA's modular and sustainable SCADA software solution, ActiveFactory software can disseminate information across a network, corporate intranet or the Internet. By supplying real-time plant information to anyone in the enterprise who needs it, ActiveFactory clients, in conjunction with other AVEVA SCADA software tools, facilitate improved plant operations and performance.

LBWD also uses AVEVA InTouch HMI for its groundwater treatment facility. As the largest groundwater treatment plant in the U.S., the department's facility is considered one of the most modern plants in the world. The Long Beach Water Department's distributed control system links nearly 1,500 data points from eight separate RTUs.

The removal of sanitary sewage from Long Beach residences and businesses is as crucial to the city's quality of life as its supply of drinking water. To efficiently manage and control its sanitary sewer and storm drains, the water department uses AVEVA's InTouch HMI to support its operator interfaces. The control system consists of two PCs and one data collection server that poll the department's 50 remote sites an average of once every minute each day. Through continuous monitoring of the city's sewer and storm drains, department operators can determine if pumping stations need to reroute water along different mains.

As part of this project, embedded system alarms also were configured to warn operators about potential sewer overfills. Deriving information from its remote telemetry units, water department operators can identify and locate sewer mainlines and assess lateral repair needs without undertaking what could be very expensive street excavation.

According to Gonzales, the department considers its current AVEVA implementation a great success. "Now that real-time data is accessible from all of the remote sites and our treatment plant, we no longer have to employ additional operators and maintenance staff to control various

equipment and pumping stations throughout the city,” he said. “Considering this advantage - along with the open nature of the solutions, and the fact that the systems can be maintained in-house - we estimate an average annual return of \$300,000 on the current investment.”

The Long Beach Water Department’s groundwater treatment plant typically processes more than 7 billion gallons of drinking water. In addition, more than 21 billion gallons of drinking water are delivered to the Long Beach community. With an eye toward the future, LBWD plans to implement AVEVA’s solutions to support new programs and create greater efficiencies throughout the department as it responds to the ever-increasing water needs of the city. With its technology solutions well in hand, Long Beach is destined to become one of the most effective, efficient and competitive municipally run water departments in California.
